

Energy Consumption, 2010

Energy consumption in 2010 was dominated by coal, which accounted for 41% of the total. Oil and natural gas followed, each accounting for 33% and 24% respectively. Renewable energy sources, including wind, solar, and hydro, accounted for a smaller portion of the total, at 12%.

The chart shows that coal is the most widely used energy source, followed by oil and natural gas. Renewable energy sources are still a small part of the total energy consumption, but their share is growing.

The data suggests that the world is still heavily reliant on fossil fuels for energy. While renewable energy sources are becoming more popular, they are still a small part of the total energy consumption.

The chart also shows that the United States and China are the two largest energy-consuming countries. The United States accounts for 21% of the total, while China accounts for 19%.

Overall, the chart shows that the world is still heavily reliant on fossil fuels for energy. While renewable energy sources are becoming more popular, they are still a small part of the total energy consumption.
